

Limestone is a sedimentary stone that is formed in warm, shallow marine waters over millions of years. Composed mostly of calcium and fragments of marine organisms such as coral and shells.

Mornington Loose Ashlar Wall Cladding is characterised by a blend of light greys and charcoals with subtle warm brown and white tones throughout.

This cladding is an artisan crafted stone with tumbled and rocky edges to achieve an organic and textural aesthetic.

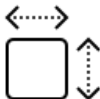

NOTE: Shade/batch variation is an inherent characteristic of all natural products. The colour of the material supplied may vary to samples/images provided.
